

A Curriculum for Implementing Pharmacogenomics Clinics in Hospitals

Emily Rousseau, PharmD Candidate and Ronald Worthington, PhD

BACKGROUND

- Pharmacogenomics knowledge can help providers make more informed decisions regarding drug selection, drug doses, and adverse event monitoring
- One of the largest challenges facing the implementation of new pharmacogenomics programs is a knowledge gap
- Only a relatively small number of publications address the education and training involved in the implementation of a pharmacogenomics clinic
- Other educational resources/courses vary in terms of cost, CE credit/certificate offered, healthcare professional focus, time, etc.

OBJECTIVES

- To develop a curriculum and associated training focused on implementation of a clinic.
- Educate clinic pharmacists to confidently make pharmacogenomic recommendations in a clinic setting
- Curriculum and training designed specifically for use at St. Louis Children's Hospital, but with minimal changes can be tailored to all new clinics

METHODS

Assessed Knowledge Gap

Held focused conversations with pharmacists at St. Louis Children's Hospital and other area hospitals.

Developed Units

Separated pharmacogenomics topics into themes, with focus on identified knowledge gap areas

Divided into Modules

Broke down current units into smaller education modules. Assigned module format and time allotted.

Gathered Resources

Reviewed updated resources, literature, lectures etc. to compile educational materials

OUTCOMES

 The curriculum and associated training were created and the curriculum outline was included in Appendix A of paper.

DISCUSSION

Strengths

 Design incorporates all clinic-specific information into one unit for easy adjustments to additional sites

DISCUSSION

Strengths

 The training materials were complied entirely from publicly available sources. This allows it to be easier to share, and will always be free.

Limitations

- Lack of continuing education hours, certificate, or other tangible incentive for completion of the training
- Publicly available education materials may be less concise and focused than developed materials

Impact

 This curriculum and associated training will directly impact the quality of patient care delivered at the St. Louis Children's Hospital Pharmacogenomics Clinic and hopefully patients at future clinics as well

NEXT STEPS

- Deliver the training and assess the pharmacist's perception of the modules and readiness for clinic duties after education.
- Evaluate pharmacists knowledge with assessment style questions.
- Demonstrate how to utilize the curriculum at sites other than St. Louis Children's Hospital
